相关性 Haemophilus influenzae is a small, non-motile Gram negative bacterium found naturally in the nasopharynx of approximately 75 percent of healthy children and adults. First described by Pfeiffer in 1892, some forty years later Pittman identified six capsular polysaccharides (types) of H. influenzae (a, b, c, d, e, and f). Similar to Haemophilus influenzae b, most cases of systemic Haemophilus influenzae a infection are in young children with meningitis being the most common disease.
