常规信息

相关性

CTF2, also known as Neuropoietin is a newly identified member of the IL6 cytokine family. CTF2 increases the platelet count associated with splenomegaly and may have an important role in neuronal precursor development and maturation. CTF2, which is predominantly expressed in neuroepithelia during embryonic life, acts through a receptor complex comprising CNTF receptor- α component, gp 130, and LIF receptor. Interestingly, the human Neuropoietin gene has evolved toward a pseudogene, suggesting that the alternative signaling via CNTF is an effective compensatory pathway.
