应用	Ab评论	说明
ICC/IF		1/50 - 1/100. This product gave a positive signal in Jurkat cells fixed with 4% formaldehyde (10 min) or 80% methanol (5 min).

靶标

功能 Protein tyrosine-protein phosphatase required for T-cell activation through the antigen receptor.

Acts as a positive regulator of T-cell coactivation upon binding to DPP4. The first PTPase domain has enzymatic activity, while the second one seems to affect the substrate specificity of the first

one. Upon T-cell activation, recruits and dephosphorylates SKAP1 and FYN.

疾病相关 Defects in PTPRC are a cause of severe combined immunodeficiency autosomal recessive T-

cell-negative/B-cell-positive/NK-cell-positive (T(-)B(+)NK(+)SCID) [MIM:608971]. A form of severe combined immunodeficiency (SCID), a genetically and clinically heterogeneous group of rare congenital disorders characterized by impairment of both humoral and cell-mediated immunity, leukopenia, and low or absent antibody levels. Patients present in infancy recurrent, persistent infections by opportunistic organisms. The common characteristic of all types of SCID

is absence of T-cell-mediated cellular immunity due to a defect in T-cell development.

Genetic variations in PTPRC are involved in multiple sclerosis susceptibility (MS) [MIM:126200]. MS is a neurodegenerative disorder characterized by the gradual accumulation of focal plaques of demyelination particularly in the periventricular areas of the brain. Peripheral nerves are not affected. Onset usually in third or fourth decade with intermittent progression over an extended

period. The cause is still uncertain.

序列相似性 Belongs to the protein-tyrosine phosphatase family. Receptor class 1/6 subfamily.

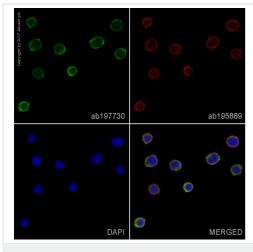

Contains 2 fibronectin type-III domains.

Contains 2 tyrosine-protein phosphatase domains.

结**构域** The first PTPase domain interacts with SKAP1.

翻译后修饰 Heavily N- and O-glycosylated.

Immunocytochemistry/ Immunofluorescence - Alexa Fluor® 488 Anti-CD45 antibody [F10-89-4] (ab197730) ab197730 staining CD45 in Jurkat cells. The cells were fixed with 4% formaldehyde (10 min), permeabilized with 0.1% Triton X-100 for 5 minutes and then blocked with 1% BSA/10% normal goat serum/0.3M glycine in 0.1% PBS-Tween for 1h. The cells were then incubated overnight at +4°C with ab197730 at 1/100 dilution (shown in green) and ab195889, Mouse monoclonal to alpha Tubulin (Alexa Fluor[®] 594), at 1/250 dilution (shown in red). Nuclear DNA was labelled with DAPI (shown in blue).

Image was taken with a confocal microscope (Leica-Microsystems, TCS SP8).

This product also gave a positive signal under the same testing conditions in Jurkat cells fixed with 80% methanol (5 min).
