靶标

功能	Molecular chaperone that promotes the maturation, structural maintenance and proper regulation of specific target proteins involved for instance in cell cycle control and signal transduction. Undergoes a functional cycle that is linked to its ATPase activity. This cycle probably induces conformational changes in the client proteins, thereby causing their activation. Interacts dynamically with various co-chaperones that modulate its substrate recognition, ATPase cycle and chaperone function.
序列相似性	Belongs to the heat shock protein 90 family.
结构域	The TPR repeat-binding motif mediates interaction with TPR repeat-containing proteins like the co-chaperone STUB1.
翻译后修饰	ISGylated. S-nitrosylated; negatively regulates the ATPase activity and the activation of eNOS by HSP90AA1.
细胞定位	Cytoplasm. Melanosome. Identified by mass spectrometry in melanosome fractions from stage I to stage IV.

ab13492 staining Hsp90 (red) and another antibody to C2GnT-M (Golgi enzyme, green) in Panc-1 cells by ICC/IF (Immunocytochemistry/immunofluorescence). Cells were fixed with PFA and blocked with 1% serum for 1 hour at 22°C. Samples were incubated with primary antibody (1/50 1% Donkey serum in PBST) for 1 hour at 22°C. An undiluted DyLight® 594-conjugated Donkey anti-mouse IgG polyclonal was used as the secondary antibody.
