#### 应用

### The Abpromise guarantee Abpromise™承诺保证使用ab99178于以下的经测试应用

"应用说明"部分下显示的仅为推荐的起始稀释度;实际最佳的稀释度/浓度应由使用者检定。

应用	Ab评论	说明
IHC-P	<b>★★★★☆ (2)</b>	Use a concentration of 10 µg/ml. Perform heat mediated antigen retrieval before commencing with IHC staining protocol.
WB		Use a concentration of 1 µg/ml. Detects a band of approximately 70 kDa (predicted molecular weight: 60 kDa).

#### 靶标

功能 Granulocyte/macrophage colony-stimulating factors are cytokines that	t act in hematopoiesis by

controlling the production, differentiation, and function of 2 related white cell populations of the blood, the granulocytes and the monocytes-macrophages. CSF-1 induces cells of the monocyte/macrophage lineage. It plays a role in immunological defenses, bone metabolism,

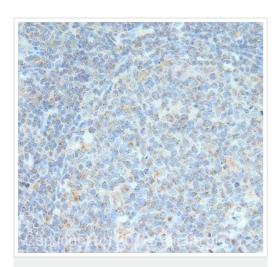

lipoproteins clearance, fertility and pregnancy.

翻译后修饰 Glycosylation and proteolytic cleavage yield different soluble forms. A high molecular weight

soluble form is a proteoglycan containing chondroitin sulfate. lsoform 1 is N- and O-glycosylated. lsoform 3 is N-glycosylated.

Immunohistochemistry (Formalin/PFA-fixed paraffinembedded sections) - Anti-M-CSF antibody (ab99178)

IHC image of MCSF staining in human tonsil formalin fixed paraffin embedded tissue section, performed on a Leica Bond TM system using the standard protocol F. The section was pre-treated using heat mediated antigen retrieval with sodium citrate buffer (pH6, epitope retrieval solution 1) for 20 mins. The section was then incubated with ab99178, 10µg/ml, for 15 mins at room temperature and detected using an HRP conjugated compact polymer system. DAB was used as the chromogen. The section was then counterstained with haematoxylin and mounted with DPX.

For other IHC staining systems (automated and non-automated) customers should optimize variable parameters such as antigen retrieval conditions, primary antibody concentration and antibody incubation times.

**Predicted band size:** 60 kDa **Observed band size:** 70 kDa

**Additional bands at:** 170 kDa, 52 kDa (possible cleavage fragment), 98 kDa. We are unsure as to the identity of these extra

Exposure time: 8 minutes

MCSF contains a number of potential glycosylation sites (SwissProt) which may explain its migration at a higher molecular weight than predicted.

ab99178 staining MCSF in mouse skin wound tissue sections by Immunohistochemistry (IHC-P - paraformaldehyde-fixed, paraffinembedded sections). Tissue was fixed with paraformaldehyde, permeabilized with 0.1% Triton X-100 for 10 minutes and blocked with 1% BSA for 30 minutes at 25°C; antigen retrieval was by heat mediation in a citrate-EDTA buffer. Samples were incubated with primary antibody (1/100 in TBS pH 7.6) for 1 hour at 25°C. A Biotinconjugated donkey anti-rabbit IgG (H+L) polyclonal (1/300) was used as the secondary antibody.
