靶标

功能 Mediates B-cell proliferation in the absence of co-stimulus as well as IgE production in the

presence of IL-4. Involved in immunoglobulin class switching.

 $\label{eq:condition} \textit{Release of soluble CD40L from platelets is partially regulated by GP \textit{Ilb/Illa}, actin polymerization, \\$

and an matrix metalloproteinases (MMP) inhibitor-sensitive pathway.

组织特异性 Specifically expressed on activated CD4+ T-lymphocytes.

疾病相关 Defects in CD40LG are the cause of X-linked immunodeficiency with hyper-lgM type 1 (HIGM1)

[MIM:308230]; also known as X-linked hyper IgM syndrome (XHIM). HIGM1 is an immunoglobulin isotype switch defect characterized by elevated concentrations of serum IgM and decreased amounts of all other isotypes. Affected males present at an early age (usually within the first year of life) recurrent bacterial and opportunistic infections, including Pneumocystis carinii pneumonia and intractable diarrhea due to cryptosporidium infection. Despite substitution treatment with intravenous immunoglobulin, the overall prognosis is rather poor, with a death rate of about 10%

before adolescence.

序列相似性 Belongs to the tumor necrosis factor family.

翻译后修饰 The soluble form derives from the membrane form by proteolytic processing.

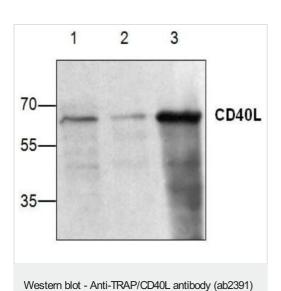

N-linked glycan is a mixture of high mannose and complex type. Glycan structure does not

influence binding affinity to CD40.

Not O-glycosylated.

细胞定位 Secreted and Cell membrane.
