靶标

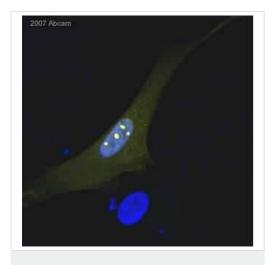

相关性

Herpes simplex virus (HSV) encodes four nuclear phosphoproteins that contribute towards the full productive lytic cycle cascade in newly infected permissive cells. The IE175 (or ICP4) and IE63 (or ICP27) proteins have essential regulatory roles during the lytic cycle. A third, IE110 (or ICP0), appears to play only an accessory role in the presence of VP16, but in the absence of VP16 appears to be critical for initiation of reactivated infections.
